The NewtonSales' USB-001 Circuit Board:

- Connects your Newton 2x00 directly to any Mac/PC
- Interconnect Port Adaptor not required
- Uses standard USB-C, not rare serial cables
- USB to serial adaptors no longer needed

Tired of fumbling around with the Interconnect 'dongle'?

The USB-001 board (similar to the 'Dongle Destroyer's Internal Serial Board) eliminates the need for *any* type of adapter to connect your Newton 2000 or 2100 to a Mac or Windows computer through USB-C.

The USB-001 is a custom designed PCB which fits internally into your Newton: you'll never be required to carry around a serial adapter, or any custom serial cables ever again! Simple DIY installation, or professionally installed for free (shipping charges apply.)

Save money by eliminating the need to purchase multiple (sometimes hard to find) cables, adapters, and converters: allow your Newton to dock to your PC & Mac quickly and easily with just a USB-C cable: available at any electronics store.

THE quick and easy way move data to and from your Newton with current USB based computers!

The board is *plug and play, simple to install* requiring only that one removes the rear housing on your Newton (4 Screws). The board outputs its connection next to the interconnect port in the space reserved for the internal serial modem.

Board reroutes the interconnect serial port: does not add an additional port. The board requires a software package to be installed on the Newton before functioning downloaded at <http://newtonsales.com/SerChannel3.zip>. Software included on the 2MB memory card if purchased.

A 2MB memory card can be added to your order for \$35 which has this package pre-installed for even easier installation it on your Newton.

Professional installation of the USB-001 is available for shipping cost only!!

Board fits inside the Newton 2000 or 2100 and requires the removal of the rear MessagePad housing. Full instructions provided.
